

The Benefits of Our Imaging

There are two important differences:

Focused Radiology Expertise

A scan is only as good as the radiologist interpreting it and our radiologists are highly experienced in reading PET/CT scans for prostate cancer. That makes a really big difference when it comes to your test results and determining any diagnosis or treatment plans you may need.

Fast Turnaround for Results

Nobody likes waiting around for results. Our goal is to discuss them with you as soon as possible. We never rush the process of reading your images. But because everyone on your team has a focus in urology, they are able to read and evaluate your images with a much higher degree of precision and knowledge. Which means you can get your results back, not only faster, but with more reliable findings.

Faster Scheduling

Our dedicated center in Westchester, IL works directly with our urologists, navigators and billing department. This streamlined process provides shorter wait times compared to hospital systems.

PSMA

PROSTATE-SPECIFIC MEMBRANE ANTIGEN

**The most advanced imaging
technology available for
detecting and tracking
prostate cancer.**

What is a PSMA scan?

A PSMA (Prostate-Specific Membrane Antigen) scan is a type of Positron Emission Tomography (PET) scan used to evaluate for metastatic disease in newly diagnosed higher risk prostate cancer, and to evaluate for disease recurrence after prior prostate cancer treatment.

What to expect at your imaging appointment

BEFORE

You do not need to prepare for your PSMA test other than to wear comfortable clothing, ideally sweatpants.

DURING

After checking in, we will have you sit in a comfortable chair and administer a safe, small injection into your arm. It will take about 60 minutes for this injection to circulate and be absorbed by your body's cells. This is a great time to relax and listen to music or do some reading.

After that, we will have you lie on a comfortable, padded table that slides into the scanner. The scan itself takes about 20 to 30 minutes.

AFTER

After the exam, you are able to leave and don't need a driver for the appointment. We encourage drinking plenty of water or juice.

Your safety and comfort are our priority the entire time. Your entire team will work closely together to provide a seamless, coordinated process from start to finish.

How does it work?

The PSMA PET/CT scan offers dramatically improved accuracy compared to older imaging techniques like conventional CT and bone scans.

Unlike traditional scans that look only at structures, the PSMA scan highlights the cancer cells themselves, making even small deposits of the disease visible.

This is possible because our PSMA scanner uses a safe, small amount of a radioactive tracer that binds directly to the PSMA protein, which is found in high quantities on prostate cancer cells. These scans help doctors stage cancer, detect recurrence after treatment, and/or guide targeted therapies, making it a crucial tool for personalized prostate cancer care.

Is PSMA covered by insurance?

PSMA scans are covered by most insurances. After discussing your medical history with you, we can check on coverage with your insurance company. We will verify eligibility prior to scheduling your test.

How soon will I get my results?

The images are seen by our team and looked over carefully. As soon as their assessments are complete, the results are sent directly to your urologist who then reviews them. Most patients receive their results 3-4 days after their study is completed. However we strive to provide them as quickly as possible without rushing any determinations.

Is the machine loud?

No, unlike an MRI machine, our PSMA scanner and the procedure does not make a lot of noise.

What if I feel claustrophobic?

Your urologist can provide options for managing anxiety before and during the test. But the staff is also very soothing during the test and will talk you through the entire process.

What are the risks and side effects?

There are no common risks to the test. The small injection can sometimes feel like a sting and on some extremely rare occasions cause nausea.
